

3-1. Procurement Integrated Enterprise Environment (PIEE)

a. PIEE is the primary enterprise procure-to-pay (P2P) application for DoD and its supporting agencies. PIEE is a procurement portfolio capability that uses a Common Access Card (CAC) enabled single-sign-on capability to grant access to system modules (e.g., Electronic Document Access and Joint Appointment Module (JAM)) hosted both internal and external to that environment. Army mandates 100% use of PIEE single-sign-on. PIEE reduces DoD operating costs by facilitating rapid development and deployment of modules and providing common services such as testing, archive retention, and security. It also improves the quality of and access to enterprise-wide data by leveraging cloud technology and drawing data from multiple modules into a single data set for use across the platform.

b. PIEE controls access and enables automation through every phase of the procurement process in addition to reducing manual data entry and administrative tasks (e.g., role nominations, workflows, data pre-population, error tracking, document management, and training certificates). PIEE's messaging capabilities provide a centralized way to securely communicate and share important information across organizations and roles. Global access to information such as reports, documents, and workflow statuses allow all users to have greater visibility into the procurement process at any time.

c. A/OPCs nominate cardholders and billing officials and track nominations and workflows within PIEE. GPC one-pagers are an excellent resource on how to perform actions within PIEE modules.
